

## Grade 9 Mathematics Worksheet

### Number Patterns

#### Questions:

1. Consider the array of dots in the following diagram:

These numbers are known as *the triangular numbers*.

- a) For this sequence of numbers, complete the table below:

<b>Picture number</b>	1	2	3	4	5	6	9
<b>Number of dots</b>	1	3	6				

- b) Show clearly how you got to  $T_9$  in this sequence.
- c) The general rule for the triangular number sequence 1 ; 3; 6; ... is  $T_n = \frac{n(n+1)}{2}$ .  
 If the sequence started at 3 and continued as normal, show how you will adjust this rule to accommodate this change?
- d) Use the rule  $T_n = \frac{n(n+1)}{2}$  to prove that two consecutive triangular numbers always add up to a square number.

## Grade 9 Mathematics Worksheet

**Solution:**

1. a)

<b>Picture number</b>	1	2	3	4	5	6	9
<b>Number of dots</b>	1	3	6	10	15	21	28

- b)  $T_2 = T_1 + 2$ ;  
 $T_3 = T_2 + 3$ ;  
 $T_4 = T_3 + 4$ ;  
 $T_5 = T_4 + 5$ ;  
 $T_6 = T_5 + 6$ ;  
 $T_7 = T_6 + 7$ ; so  $T_9 = T_8 + 9$  or in general the recursive pattern is  $T_{n+1} = T_n + (n+1)$ .

- c) This will be a horizontal translation of 1 unit to the left for the sequence. It thus becomes:

<b>Picture number</b>	1	2	3
<b>Number of dots</b>	3	6	10

d)  $T_n = \frac{(n+1)(n+1+1)}{2} = \frac{(n+1)(n+2)}{2}$ .

For two consecutive numbers that are triangular:

$$T_n = \frac{n(n+1)}{2} \text{ and } T_{n+1} = \frac{(n+1)(n+2)}{2}.$$

So:

$$\begin{aligned}
 T_n + T_{n+1} &= \frac{n(n+1)}{2} + \frac{(n+1)(n+2)}{2} \\
 &= \frac{(n+1)(n+n+2)}{2} \\
 &= \frac{(n+1)(2n+2)}{2} \\
 &= \frac{2(n+1)(n+1)}{2} \\
 &= (n+1)^2
 \end{aligned}$$

This is clearly a square number.

Learners learn about sequences by looking at them recursively – that is what happens to the previous term to obtain the next term.

## Grade 9 Mathematics Worksheet

---

The translation is one unit to the left for the sequence, so that term 1 is now 3. Thus we need to change the  $n$  in the sequence to  $n + 1$  to accommodate this translation. Another way to look at this is realise that  $n$  is still one and that what we change in the generalised number must have an output of 3.
